

# CHEMICAL INDUSTRY NEEDS FROM OILSEED CROPS

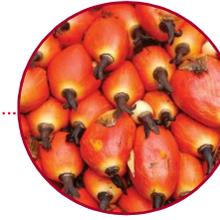

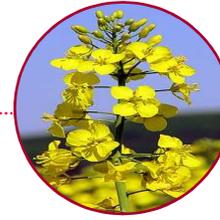

JEAN-LUC DUBOIS

SCIENTIFIC DIRECTOR

**ARKEMA**  
INNOVATIVE CHEMISTRY

# FATTY ACIDS METHYL ESTERS

❖ Major application: Biodiesel, Solvent

❖ Process: transesterification.

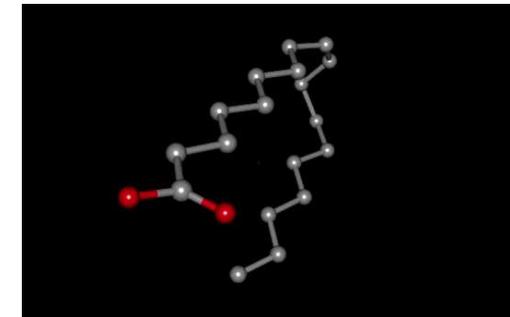

- Methanol (alcohol) reaction with triglyceride. Coproduce glycerol.

❖ Technical requirements:

- Cetane Index → equivalent to Octane index for gasoline
- Viscosity → impact on smoke
- Oxidation stability → no degradation over time
- Cold flow properties → liquid even in winter time
- Low corrosion → no free fatty acids.

❖ What does it mean in terms of appropriate fatty acid

- Oleic acid (C18:1)

❖ Appropriate vegetable oils:

- Rapeseed oil (year round), Palm oil (summer), Soybean oil.

# RENEWABLE DIESEL

## ❖ Major application: Fuels

## ❖ Process: Hydrogenation

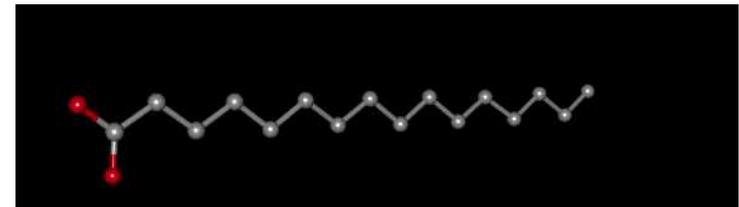

- Hydrogenation of triglyceride/fatty acids. Coproduce propane.

## ❖ Technical requirements:

- Cetane Index → equivalent to Octane index for gasoline
- Viscosity → impact on smoke
- Oxidation stability → no degradation over time
- Cold flow properties → liquid even in winter time

## ❖ What does it mean in terms of appropriate fatty acid

- Palmitic acid (C16:0), Stearic acid (C18:0)

## ❖ Appropriate vegetable oils:

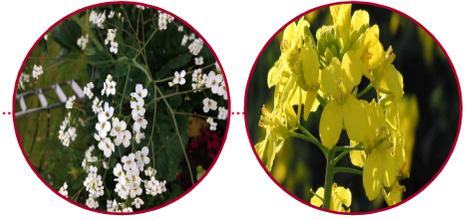

- Palm Oil, Beef tallow, Animal fats, Free fatty acids, Waste cooking oil.

# INTERESTERIFIED FATS

---

- ❖ **Major application: margarine; cocoa butter equivalent...**
- ❖ **Process: catalytic or enzymatic interesterification**
  - Mixed oils + catalyst/enzymes → new triglyceride by chain redistribution
- ❖ **Technical requirements of final product:**
  - Crystallinity → Melting point, Mouth feeling
  - Stability
- ❖ **What does it mean in terms of appropriate fatty acid**
  - Depending on the targeted product. Need a blend of saturated and unsaturated fatty acids
- ❖ **Appropriate vegetable oils:**
  - Diverse. Includes fully hydrogenated vegetable oils → No trans fatty acids.

# FATTY AMIDES

❖ Major application: Slip Agent, internal lubricants

❖ Process: Amidification

- Reaction of fatty acid with ammonia (NH<sub>3</sub>)

❖ Technical requirements/Market:

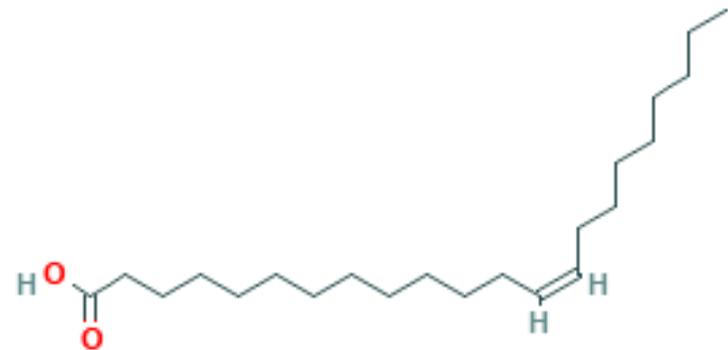

- Slip agent: avoid plastic films to stick on each other.

❖ What does it mean in terms of appropriate fatty acid

- Erucic Acid (C22:1)

❖ Appropriate vegetable oils:

- High Erucic Acid Rapeseed, Crambe,
- Ethiopian mustard, Pennycress (lower C22:1)

# FATTY AMINES

❖ Major application: Surfactants, Oilfield chemicals

❖ Process: Ammoniation of fatty acids, and Hydrogenation

- Fatty acid + Ammonia → Fatty amide
- Fatty amide + Hydrogen → Fatty amine

❖ Technical requirements:

- Surfactant properties
- Oxygen stability
- Low temperature properties

❖ What does it mean in terms of appropriate fatty acid

- Palmitic acid (C16:0), Stearic acid (C18:0), Oleic acid (C18:1), Lauric acid (C12:0)

❖ Appropriate vegetable oils:

- Beef tallow, Animal fats, Palm oil, Coconut oil, Palm Kernel oil.

# FATTY ALCOHOLS

❖ Major application: Surfactants / Detergents

❖ Process: Fatty acid / Fatty ester hydrogenation

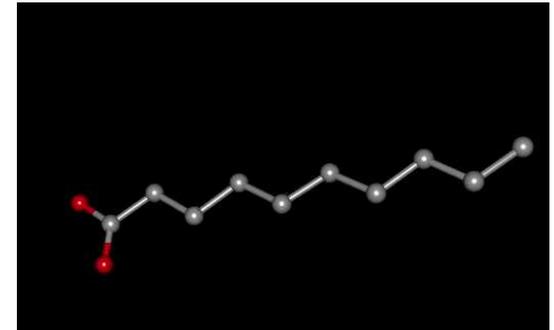

- High pressure process. Fatty acid + Hydrogen → Fatty ester → Fatty alcohol

❖ Technical requirements:

- Liquid soaps now preferred.

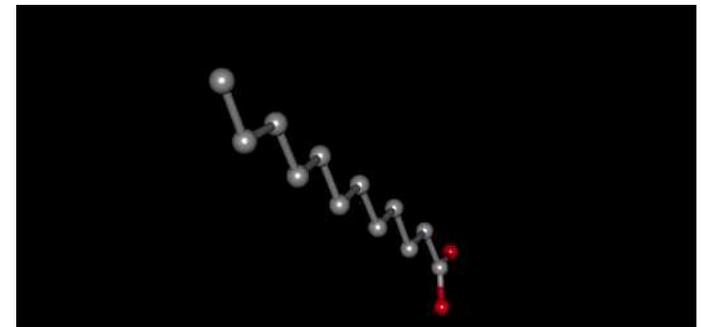

❖ What does it mean in terms of appropriate fatty acid

- Lauric acid (C12:0); Capric acid (C10:0) ; Caproic acid (C8:0)

❖ Appropriate vegetable oils:

- Coconut oil, Palm Kernel oil.

# GUERBET ALCOHOLS

❖ Major application: Biolubricants, Cosmetics

❖ Process: Guerbet reaction

- 2 long chain alcohols → Branched alcohols

❖ Technical requirements:

- Cold flow properties → branching on the chain
- Stability → hydrogenated
- Boiling point → chain length

❖ What does it mean in terms of appropriate fatty acid

- Monounsaturated fatty acids (C8 +).
- Demand for C8, C10, C12, C16

❖ Appropriate vegetable oils:

- Coconut oil, Palm Kernel oil, Palm Oil...

# MONOMER/DIMER/TRIMER

❖ Major application: paste soap, detergents, lubricants, printing inks, corrosion inhibitors...

❖ Process: Diels Alders type reaction

- Diels alders reaction: 2 unsaturated fatty acids reacting together through double bonds → generates diacids/triacids

❖ Technical requirements:

- Low temperature liquid properties.

❖ What does it mean in terms of appropriate fatty acid

- Polyunsaturated fatty acids: Linoleic acid (C18:2), Linolenic acid (C18:3) sometimes combined with terminal unsaturated fatty acid

❖ Appropriate vegetable oils:

- Linseed oil, Soybean oil, High Linoleic Sunflower, High Linoleic Safflower, Hemp, Cardoon oils

# ALKYD RESINS

❖ Major application: Paints and Varnishes

❖ Process: esterification with polyols.

❖ Technical requirements:

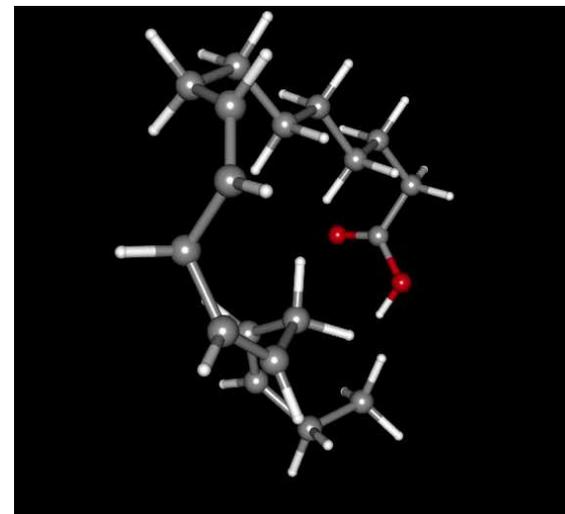

- Siccative property (self drying)

❖ What does it mean in terms of appropriate fatty acid

- PolyUnsaturated Fatty Acids (PUFA). Linolenic acid (C18:3); Linoleic (C18:2)
- Dehydrated Castor oil (conjugated linoleic acid C18:2),
- Hydroxystearic acid (C18:0, OH)

❖ Appropriate vegetable oils:

- Linseed oil, High Linolenic safflower oil, Camelina, Castor.

# POLYAMIDE

❖ Major application: Specialty Polymers

❖ Processes: Oil dependant

- Transesterification, thermal cleavage, hydrolysis, hydrobromination, ammonolysis → Castor Oil to Polyamide 11
- Hydrolysis, alkaline cleavage, acidification (sebacic acid-DC10)/ ammoniation, hydrogenation (DA10) → Castor oil to Polyamide 10.10

❖ Technical requirements:

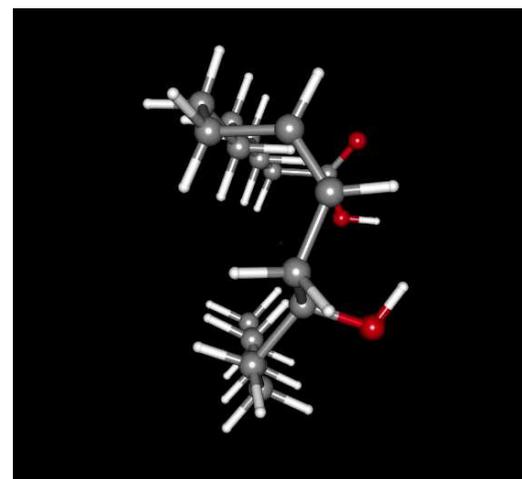

- Hydroxyfatty acid, with chain  $R'-(CH_2)_n-CH=CH-CH_2-CHOH-R$

❖ What does it mean in terms of appropriate fatty acid

- Ricinoleic acid (C18:1, OH); Lesquerolic acid (C20:1, OH)

❖ Appropriate vegetable oils:

- Castor oil, Lesquerella oil

# EPOXYDIZED OILS

❖ **Major application: Secondary plasticizers, polyols**

❖ **Process: epoxidation with peracids**

- Oil + peracetic or performic acid → epoxidized oil

❖ **Technical requirements:**

- High number of epoxide functions

❖ **What does it mean in terms of appropriate fatty acid**

- Linolenic acid (C18:3), Linoleic acid (C18:2)

❖ **Appropriate vegetable oils:**

- Linseed oil, Soybean oil, Camelina oil

# METATHESIS PRODUCTS

❖ Major application: Monomers, Lubricants, pheromones

❖ Process: self and cross-metathesis

- MUFA + Ethylene → w-unsaturated fatty ester
- e.g: Methyl Oleate C18:1 + CH<sub>2</sub>=CH<sub>2</sub> → Methyl 9-Decenoate (C10:1) + 1-decene
- Cross metathesis:
- Methyl 10-undecenoate + CH<sub>2</sub>=CH-CN → NC-CH=CH-(CH<sub>2</sub>)<sub>8</sub>-COOCH<sub>3</sub> → monomer
- Self metathesis: 2 Fatty acid ester → Diester + olefin

❖ Technical requirements:

- Chain length specific → affects polymer crystallinity
- Low contamination with monofunctional fatty acids → affects chain length
- Peroxide content

❖ What does it mean in terms of appropriate fatty acid

- MonoUnsaturated Fatty Acids (MUFA): Oleic acid (C18:1); 9-decenoic acid; 10-undecenoic acid

❖ Appropriate vegetable oils:

- Palm Oil; high oleic oils (HO Rapeseed, Sunflower, Soybean, Safflower, Camelina,...)

# OXIDATIVE CLEAVAGE (OZONE O<sub>3</sub>/H<sub>2</sub>O<sub>2</sub>) PRODUCTS

## ❖ Major application:

- Azelaic (DC9) and Brassylic (DC13) acids → Diacids, lubricants, plasticizers, monomers; flavor and Fragrances.
- Pelargonic acid (C9): Herbicide

## ❖ Process: Ozonolysis or H<sub>2</sub>O<sub>2</sub> cleavage

- Fatty acid + O<sub>3</sub> → Diacid + Monoacid (e.g.: oleic → Azelaic (DC9) + Pelargonic)
- Fatty acid / Fatty ester / Fatty Nitrile + H<sub>2</sub>O<sub>2</sub> → Diacid/nitrile-acid + monoacid
- Reductive Ozonolysis → Aldehyde production (Fragrances)

## ❖ Technical requirements:

- Chain length selectivity → affects polymer crystallinity
- Extremely low monofunctional content → affects chain length

## ❖ What does it mean in terms of appropriate fatty acid

- MonoUnsaturated Fatty Acid (MUFA): Oleic acid (C<sub>18</sub>:1);
- Gondoic acid (C<sub>20</sub>:1); Erucic acid (C<sub>22</sub>:1)

## ❖ Appropriate vegetable oils:

- HO sunflower, HO safflower, HO Camelina, Crambe, HEAR, ... HO Cardoon... Beef tallow, animal fats.

# C18:1 AND C18:2 OILS

---

✦ C18:1,

✦ Rapeseed, Palm, High oleic sunflower, HO Safflower

✦ C18:2

✦ Sunflower, Safflower, Cardoon

# C18:3 AND C22:1 OILS

---

✦ C22:1

✦ Crambe; High Erucic Rapeseed

✦ C18:3

✦ Linseed, Camelina, Soybean

# HYDROXY FATTY ACIDS AND MEDIUM CHAIN OIL

---

✦ C18:1, OH – C20:1, OH

✦ Castor, Lesquerella

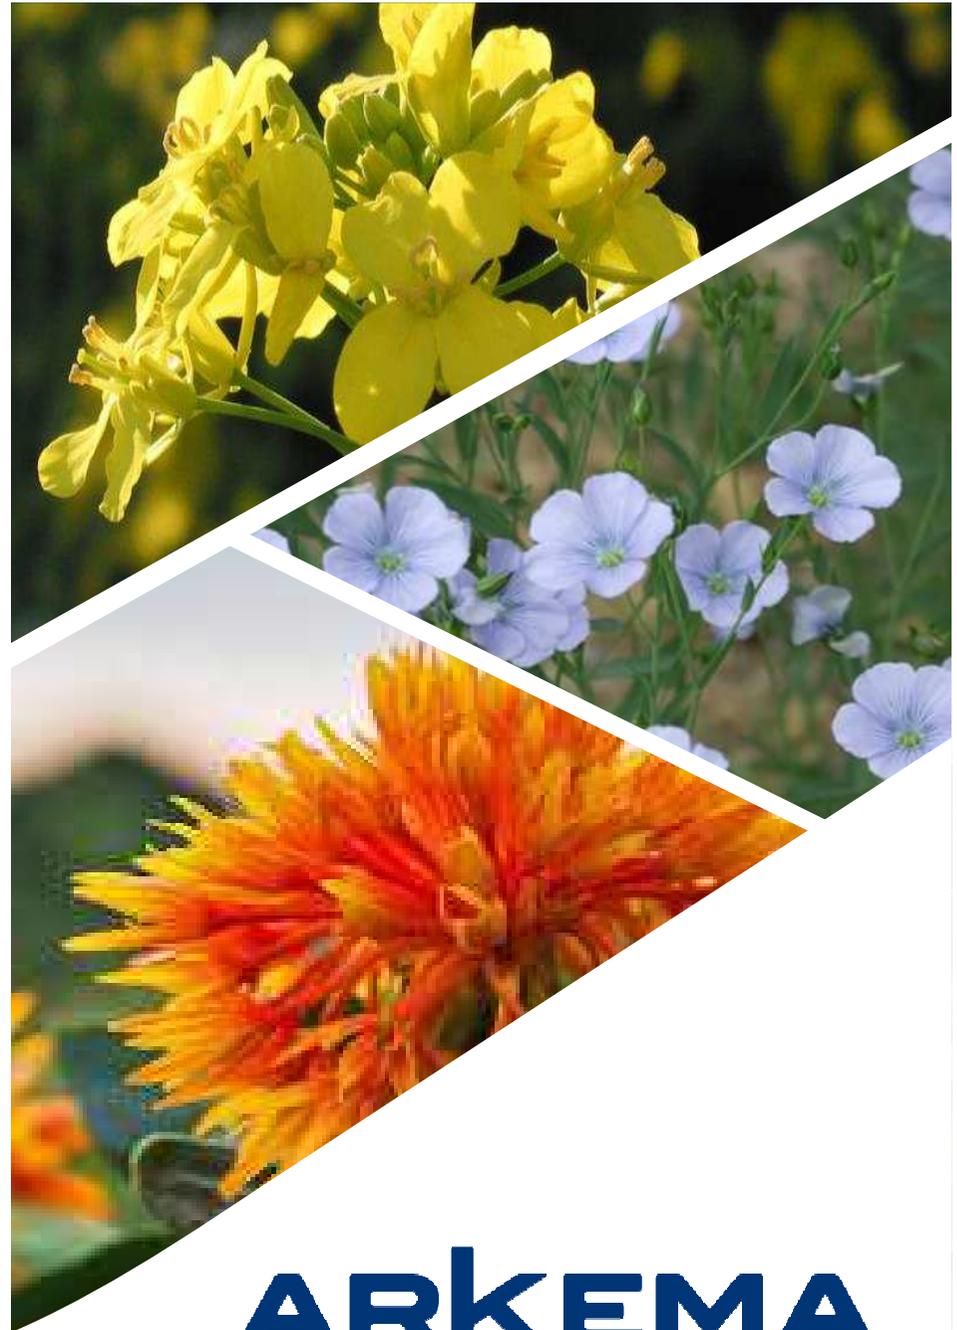

✦ C8, C10, C12

✦ Coconut, Palm Kernel
